Summary

Full Stack Developer with 2 years and 1 month of experience in web development: building, testing, and maintaining web applications in React.js, TypeScript, and JavaScript, and RESTful APIs and server-side logic in FastAPI and Flask backed by MySQL, MongoDB, PostgreSQL, and Oracle. Delivered 3 production applications for NetApp, including a legacy ExtJS-to-React migration with reusable Material UI and AG Grid components; integrates user-facing interfaces with back-end APIs, and troubleshoots and resolves defects with QA and front-end and back-end teams. Uses Git daily. Immediate joiner.

Skills

Languages: JavaScript, TypeScript, Python, SQL, HTML, CSS
Frameworks/Libraries: React.js, Next.js, Node.js, REST APIs, Material UI, AG Grid, FastAPI, Flask, Django (ORM)
Databases: MySQL, MongoDB, PostgreSQL, Oracle
Practices: Web Development, Front-end and Back-end Development, RESTful API Development, Troubleshooting and Debugging, Unit Testing (pytest)
Tools/Platforms: Git, Linux, Jira, Unit Testing (pytest), CI/CD (Jenkins), Docker, Kubernetes, Kafka, Airflow, Dynatrace, Dremio, Spark, AWS (S3), Google Cloud (Foundation)

Experience

Onstak Technologies Pvt Ltd — Bengaluru, India
Software Engineer — *Sep 2024 – Present*

- Delivered **3 internal applications** for NetApp (DLH Insights Dashboard, CRS Pipeline Dashboard, and SmartSolve UI Modernization), described under Projects.

Data Platform Operations and Incident Handling (Client: NetApp)

- Investigated Dremio data dips through event and application logs, re-queued failed ASUP events to the right Kafka consumer groups, and confirmed the records were processed before closing each incident.
- Recovered Kafka consumer groups with a lag of 30 lakh (3 million) messages or more when pods got stuck, offsets stopped moving, or consumers kept rebalancing, since missing the per-minute ASUP processing thresholds would breach the SLA and leave data unavailable downstream.
- Cleared such backlogs by scaling the consumer pods to 0 replicas, saving the backlog to a file, splitting it into chunks and reprocessing them one after another, renaming each processed chunk to track progress and avoid reprocessing.
- Restored stuck pods by deleting them so Kubernetes recreated them with the same configuration, then confirmed data was flowing again.
- Used a Dynatrace dashboard to spot SLA breaches, which mostly happened on high-load weekends, and increased pod resources and enabled autoscaling to handle the peak load.
- Managed Dremio dataset access for NetApp users, verifying each request and granting only suitable datasets so large unfiltered queries did not block other users' queues.

Daily Data Load Monitoring (Client: NetApp)

- Monitored **25+ Airflow load jobs** (**7 data sources**, each in secure and non-secure form) that move source tables into destination tables, using 2 separate credential sets.
- Compared each run with the previous day and, for long-running steps, inspected the DAG, cleared the stuck run, and retriggered it.
- Validated destination row counts against the prior 1-week window and backfilled from the source when data was missing.

Production Patching Support (Client: NetApp)

- Supported production patching with the Unix team, patching about **10 Dremio worker nodes (16 executors)** one at a time after pausing executors so running queries were not interrupted, then verified through **5 interfaces** (UI, REST API, JDBC, ODBC, and Arrow Flight).
- Applied patches to Spark nodes used by Airflow jobs and confirmed each was reachable with no mount issues.

Platform Engineering Contributions

- Containerized an internal cache refresher utility with Docker and MongoDB, containerized the existing legacy Spark framework, supported chatbot data ingestion and schema tasks, and created Dremio VDS views.
- Wrote pytest test cases covering API responses and edge cases for the backend components built.

Projects

SmartSolve UI Modernization (Client: NetApp)

Tech Stack: React, TypeScript, Material UI, AG Grid

- Migrated legacy **ExtJS modules to React, TypeScript, and Material UI** with reusable components.
- Engineered a **reusable AG Grid table** with search, filtering, and sorting, used across modules.
- Persisted UI state, such as drawer open/closed, through the user-preferences API so layouts stayed consistent across logins and devices.
- Created a side-by-side text comparison component that highlights differences between 2 data sections.
- Optimized rendering with shared state and memoization (caching), added authentication and route-level access checks, and fixed production defects with QA through release cycles.

DLH Insights Dashboard (Client: NetApp)

Tech Stack: React, TypeScript, Material UI, Python, FastAPI, PostgreSQL, Dremio, Docker, Kubernetes

- Developed a **data-lake monitoring dashboard** on FastAPI services with PostgreSQL and Dremio, covering users, storage, node health, data quality, incidents, vulnerabilities, and pipelines.
- Introduced a monthly cumulative user-growth graph showing how many users have Dremio access over time, which was not tracked before.
- Tracked new tables ingested into the data lake and the daily refresh status of 2 databases (secure and non-secure) logged by Airflow jobs, marking data fresh when under 1 day old.
- Implemented a node-health view, a data quality check on the 20 most-used tables ranked from daily query trends, and 1 incidents tab combining data quality and Dremio access incidents.
- Designed an EPROD pipeline monitor with **Kafka consumer lag** and 4 look-back windows (6, 12, 18, and 24 hours) to find when data stopped flowing.
- Automated a **daily 6:00 AM IST cron job** that syncs Dremio users, tables, and views into PostgreSQL with an email alert, cutting repeated Dremio queries; deployed with Docker and Kubernetes.

Smartphone Addiction Predictor (Full-Stack ML Web App)

Tech Stack: Python, FastAPI, scikit-learn, TensorFlow, React, TypeScript, Firebase Authentication

- Built a full-stack web app that predicts smartphone addiction from 19 survey inputs, with a FastAPI backend exposing /predict and /health endpoints and a React and TypeScript frontend.
- Trained and served **4 models** (Decision Tree, Random Forest, Logistic Regression, and a 1D CNN) on a 5,000-row survey dataset using scikit-learn and TensorFlow, with feature encoding and scaling; users choose the model per request.
- Validated API requests with Pydantic schemas, configured CORS for the deployed frontend, and added a backend status indicator in the UI.
- Added Firebase email and password authentication (register, login, password reset), a 4-step form with per-step validation, and a dark mode theme.

CRS Pipeline Dashboard (Client: NetApp)

Tech Stack: Python, Flask, MySQL, Oracle, Airflow, Dynatrace, Kubernetes

- Consolidated **3 groups of Airflow jobs** (CRS, DEDL, EDL), materialized-view refreshes, DataHub failures, and server health into 1 dashboard.
- Integrated Flask with 3 data sources (MySQL, Oracle, and Dynatrace) to show run status, history, error details, and health metrics.
- Enabled Excel export and deployed on **Kubernetes** with an Ingress and health probes.

Education

Sree Vidyanikethan Engineering College — India

Bachelor of Technology in Information Technology — *Jan 2021 – May 2024*

Certifications

100 Days of Code: The Complete Python Pro Bootcamp: Udemy

Google Cloud Computing Foundation: Google

HackerRank Python (Basic) Certificate: HackerRank
